Alanine Aminotransferase Activity Assay Kit

Catalog Number MAK052
Storage Temperature –20 °C

TECHNICAL BULLETIN

Product Description
Alanine Aminotransferase (ALT), also known as serum glutamic-pyruvic transaminase (SGPT), is a pyridoxal-phosphate-dependent enzyme that catalyzes the reversible transfer of an amino group from alanine to α-ketoglutarate, generating pyruvate and glutamate. ALT is found primarily in liver and serum, but occurs in other tissues as well. Hepatocellular injury often results in an increase of serum ALT levels and serum ALT levels can be used as a marker for liver injury.

The ALT Activity Assay Kit provides a simple and direct procedure for measuring ALT activity in a variety of biological samples.

ALT activity is determined by a coupled enzyme assay, which results in a colorimetric (570 nm)/fluorometric (λ_ex = 535/λ_em = 587 nm) product, proportional to the pyruvate generated. One unit of ALT is defined as the amount of enzyme that generates 1.0 µmole of pyruvate per minute at 37 °C.

Components
The kit is sufficient for 100 assays in 96 well plates.

ALT Assay Buffer
Catalog Number MAK052A
25 mL

Fluorescent Peroxidase Substrate, in DMSO
Catalog Number MAK052B
0.2 mL

ALT Enzyme Mix
Catalog Number MAK052C
1 vl

ALT Substrate
Catalog Number MAK052D
1 vl

Pyruvate Standard, 100 nmole/µL
Catalog Number MAK052E
0.1 mL

ALT Positive Control
Catalog Number MAK052F
1 vl

Reagents and Equipment Required but Not Provided.
- 96 well flat-bottom plate – It is recommended to use black plates with clear bottoms for fluorescence assays and clear plates for colorimetric assays.
- Fluorescence or spectrophotometric multiwell plate reader

Precautions and Disclaimer
This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Preparation Instructions
Briefly centrifuge vials before opening. Use ultrapure water for the preparation of reagents. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

ALT Assay Buffer – Allow buffer to come to room temperature before use.

Fluorescent Peroxidase Substrate – Allow reagent to come to room temperature before use. Mix well by pipetting, then aliquot and store, protected from light and moisture, at –20 °C.

ALT Enzyme Mix – Reconstitute in 220 µL of water. Mix well by pipetting, then aliquot and store at –20 °C. Use within two months of reconstitution.

ALT Substrate – Reconstitute in 1.1 mL of ALT Assay Buffer. Mix well by pipetting, then aliquot and store at –20 °C. Keep cold while in use. Use within two months of reconstitution.

ALT Positive Control – Reconstitute in 100 µL of water. Mix well by pipetting, then aliquot and store at –20 °C. Keep cold while in use. Use within two months of reconstitution.
Storage/Stability
The kit is shipped on wet ice. Storage at –20 °C, protected from light, is recommended.

Procedure
All samples and standards should be run in duplicate.

Pyruvate Standards for Colorimetric Detection
Dilute 10 μL of the 100 nmole/μL Pyruvate Standard with 990 μl of ALT Assay Buffer to prepare a 1 nmole/μL standard solution. Add 0, 2, 4, 6, 8, and 10 μL of the 1 nmole/μL standard solution into a 96 well plate, generating 0 (blank), 2, 4, 6, 8, and 10 nmole/well standards. Add ALT Assay Buffer to each well to bring the volume to 20 μL.

Pyruvate Standards for Fluorometric Detection
Prepare a 1 nmole/μL standard solution as for the colorimetric assay. Dilute 10 μL of the 1 nmole/μL standard solution with 90 μL of ALT Assay Buffer to make a 0.1 nmole/μL standard solution. Add 0, 2, 4, 6, 8, and 10 μL of the 0.1 nmole/μL standard solution into a 96 well plate, generating 0 (blank), 0.2, 0.4, 0.6, 0.8, and 1.0 nmole/well standards. Add ALT Assay Buffer to each well to bring the volume to 20 μL.

Sample Preparation
Both the colorimetric and fluorometric assays require 20 μL of sample for each reaction (well).

Tissue (50 mg) or cells (1 × 10^6) should be rapidly homogenized with 200 μL of ALT Assay Buffer. Centrifuge at 15,000 × g for 10 minutes to remove insoluble materials.

Serum samples can be directly added to wells. Add 1–20 μL samples into wells of a 96 well plate.

Bring samples to a final volume of 20 μL with ALT Assay Buffer. For unknown samples, it is suggested to test several sample volumes to make sure the readings are within the standard curve range.

For the positive control (optional), add 5 μL of the ALT Positive Control to wells. Adjust well volume to 20 μL with ALT Assay Buffer.

Assay Reaction
1. Set up the Master Reaction Mix according to the scheme in Table 1. 100 μL of the Master Reaction Mix is required for each reaction (well). Prepare enough Master Reaction Mix for the number of samples, positive controls, and standards to be performed.

Table 1. Master Reaction Mix

<td>2 μL</td>
</tr>
<tr>
<td>ALT Substrate</td>
<td>10 μL</td>
</tr>
</tbody>
</table>

2. Add 100 μL of the Master Reaction Mix to each of the standard, positive control, and test wells. Mix well using a horizontal shaker or by pipetting.

3. After 2–3 minutes, take the initial measurement (T_initial). For colorimetric assays, measure the absorbance at 570 nm (A_570). For fluorometric assays, measure fluorescence intensity (FLU_initial, λ_ex = 535/λ_em = 587 nm).

4. Incubate the plate at 37 °C taking measurements every 5 minutes. Protect the plate from light during the incubation.

5. Continue taking measurements until the value of the most active sample is greater than the value of the highest standard. At this time the most active sample is near or exceeds the end of the linear range of the standard curve.

6. The final measurement for calculating the enzyme activity would be the penultimate reading or the value before the most active sample is near or exceeds the end of the linear range of the standard curve. The time of the penultimate reading is T_final.

7. Calculate the change in measurement from T_initial to T_final for the samples and positive control.

\[ \Delta A_{570} = (A_{570})_{\text{final}} - (A_{570})_{\text{initial}} \]

or

\[ \Delta \text{FLU} = (\text{FLU}_{\text{final}}) - (\text{FLU}_{\text{initial}}) \]

Note: It is essential the initial and final measurements fall within the linear range of the reaction.
Results
Calculations
Correct for the background by subtracting the value obtained for the 0 (blank) standard from all standard readings.

Plot the pyruvate standard curve using the $T_{\text{final}}$ readings.

Compare the $\Delta$measurement value ($\Delta A_{570}$ or $\Delta \text{FLU}$) of each sample to the standard curve to determine the amount of pyruvate generated between $T_{\text{initial}}$ and $T_{\text{final}}$ (B).

Note: A new standard curve must be set up each time the assay is run.

The ALT activity of a sample may be determined by the following equation:

$$\text{ALT Activity} = \frac{B \times \text{Sample Dilution Factor}}{(T_{\text{final}} - T_{\text{initial}}) \times V}$$

$B =$ Amount (nmole) of pyruvate generated between $T_{\text{initial}}$ and $T_{\text{final}}$

$T_{\text{initial}} =$ Time of first reading in minutes.

$T_{\text{final}} =$ Time of penultimate reading in minutes.

$V =$ sample volume (mL) added to well.

ALT activity reported as nmole/min/mL = milliunit/mL, where one milliunit (mU) of ALT is defined as the amount of enzyme that generates 1.0 nmole of pyruvate per minute at 37 °C.
