Product Information

Aspartate Aminotransferase (AST) Activity Assay Kit

Catalog Number MAK055
Storage Temperature –20 °C

TECHNICAL BULLETIN

Product Description
Aspartate Aminotransferase (AST), formerly called serum glutamate-oxaloacetate transaminase (SGOT), is a pyridoxal phosphate (PLP)-dependent enzyme that catalyzes the conversion of aspartate and α-keto-glutarate to oxaloacetate and glutamate. Similar to Alanine Aminotransferase (ALT), AST levels in blood are commonly used as a marker for liver function. However, AST has a broader tissue distribution than ALT and perturbations in AST levels can occur in response to diseases or injuries in multiple tissues including skeletal and heart.

The Aspartate Aminotransferase Activity Assay kit provides a simple and direct procedure for measuring AST activity in a variety of samples. In this kit, the transfer of an amino group from aspartate to α-keto-glutarate results in the generation of glutamate, resulting in the production of a colorimetric (450 nm) product proportional to the AST enzymatic activity present. One unit of AST is the amount of enzyme that will generate 1.0 μmole of glutamate per minute at pH 8.0 at 37 °C.

Components
The kit is sufficient for 100 assays in 96 well plates.

AST Assay Buffer, 25 mL
Catalog Number MAK055A

AST Enzyme Mix, 1 vl
Catalog Number MAK055B

AST Developer, 1 vl
Catalog Number MAK055C

AST Substrate, 1 vl
Catalog Number MAK055D

Glutamate Standard, 0.1 M, 0.1 mL
Catalog Number MAK055E

AST Positive Control, 1 vl
Catalog Number MAK055F

Reagents and Equipment Required but Not Provided.
- 96 well flat-bottom plate – It is recommended to use clear plates for colorimetric assays.
- Spectrophotometric multiwell plate reader

Precautions and Disclaimer
This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Preparation Instructions
Briefly centrifuge vials before opening. Use ultrapure water for the preparation of reagents. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

AST Assay Buffer – Allow buffer to come to room temperature before use.

AST Enzyme Mix – Reconstitute with 220 μL of water. Mix well by pipetting (don’t vortex), then aliquot and store, protected from light, at –20 °C. Use within 2 months of reconstitution.

AST Developer – Reconstitute with 820 μL of water. Mix well by pipetting (don’t vortex), then aliquot and store, protected from light, at –20 °C. Use within 2 months of reconstitution.

AST Substrate – Reconstitute with 1.1 mL of AST Assay Buffer. Mix well by pipetting (don’t vortex), then aliquot and store, protected from light, at –20 °C. Use within 2 months of reconstitution.

AST Positive Control – Reconstitute with 100 μL of water. Mix well by pipetting, then aliquot and store, protected from light, at –20 °C. Use within 2 months of reconstitution and keep cold while in use.

Storage/Stability
The kit is shipped on wet ice and storage at –20 °C, protected from light, is recommended.
**Procedure**

All samples and standards should be run in duplicate.

**Glutamate Standards for Colorimetric Detection**

Dilute 10 μL of the 0.1 M Glutamate Standard solution with 990 μL of the AST Assay Buffer to prepare a 1 mM standard solution. Add 0, 2, 4, 6, 8, and 10 μL of the 1 mM standard solution into a 96 well plate, generating 0 (blank), 2, 4, 6, 8, and 10 nmole/well standards. Add AST Assay Buffer to each well to bring the volume to 50 μL.

**Sample Preparation**

Tissue (50 mg) or cells (1 × 10^6) can be homogenized in 200 μL of ice-cold AST Assay Buffer. Centrifuge the samples at 13,000 × g for 10 minutes to remove insoluble material.

Serum samples can be directly added to wells.

**Note:** For unknown samples, it is suggested to test several sample dilutions to ensure the readings are within the linear range of the standard curve.

Bring samples to a final volume of 50 μL with AST Assay Buffer.

For the positive control (optional), add 5 μL of the AST positive control solution to wells and adjust to 50 μL with the AST Assay Buffer.

**Assay Reaction**

1. Set up the Master Reaction Mix according to the scheme in Table 1. 100 μL of the Reaction Mix is required for each reaction (well).

**Table 1.**

**Master Reaction Mix**

</tbody>
</table>

2. Add 100 μL of the Reaction Mix to each of the wells. Mix well using a horizontal shaker or by pipetting. Protect the plate from light during the incubation.

3. Incubate the plate at 37 °C. After 2–3 minutes, take the initial measurement (T_{initial}). Measure the absorbance at 450 nm at the initial time (A_{450})_{initial}. **Note:** It is essential (A_{450})_{initial} is in the linear range of the standard curve.

4. Continue to incubate the plate at 37 °C taking measurements (A_{450}) every 5 minutes. Protect the plate from light during the incubation.

5. Continue taking measurements until the value of the most active sample is greater than the value of the highest standard (10 nmole/well). At this time the most active sample is near or exceeds the end of the linear range of the standard curve.

6. The final measurement ([A_{450}]_{final}) for calculating the enzyme activity would be penultimate reading or the value before the most active sample is near or exceeds the end of the linear range of the standard curve, see step 5. The time of the penultimate reading is T_{final}. **Note:** It is essential the final measurement falls within the linear range of the standard curve.
Results

Calculations
Correct for the background by subtracting the final measurement \((A_{450})_{\text{final}}\) obtained for the 0 (blank) Glutamate standard from the final measurement \((A_{450})_{\text{final}}\) of the standards. Background values can be significant. Plot the Glutamate standard curve.

Note: A new standard curve must be set up each time the assay is run.

Calculate the change in measurement from \(T_{\text{initial}}\) to \(T_{\text{final}}\) for the samples.

\[
\Delta A_{450} = (A_{450})_{\text{final}} - (A_{450})_{\text{initial}}
\]

Compare the \(\Delta A_{450}\) of each sample to the standard curve to determine the amount of glutamate generated by the aminotransferase assay between \(T_{\text{initial}}\) and \(T_{\text{final}}\) (B).

The AST activity of a sample may be determined by the following equation:

\[
\text{AST Activity} = \frac{B \times \text{Sample Dilution Factor}}{(\text{Reaction Time}) \times V}
\]

\(B = \) Amount (nmole) of glutamate generated between \(T_{\text{initial}}\) and \(T_{\text{final}}\).

\(\text{Reaction Time} = T_{\text{final}} - T_{\text{initial}}\) (minutes)

\(V = \) sample volume (mL) added to well

AST activity is reported as nmole/min/mL = milliunit/mL

One unit of AST is the amount of enzyme that will generate 1.0 \(\mu\)mole of glutamate per minute at pH 8.0 at 37 \(^\circ\)C.

Example:
Glutamate amount (B) = 5.84 nmole
First reading \((T_{\text{initial}}) = 3\) minute
Second reading \((T_{\text{final}}) = 32\) minutes
Sample volume (V) = 0.01 mL
Sample dilution is 1

AST activity is:

\[
\frac{5.84 \times 1}{(32-3) \times 0.01} = 20.14 \text{ milliunits/mL}
\]
