Mouse IgA,\(\lambda\) (MOPC 315)
Purified Immunoglobulin

Product No. M 2046

Product Description
The MOPC 315 tumor line that produces mouse IgA,\(\lambda\) is a mineral oil-induced plasmacytoma originated and carried subcutaneously in BALB/c mice. The hapten binding specificity of the MOPC 315 line is for nitrophenylated proteins. The IgA,\(\lambda\) purified from ascites fluid is provided as a solution in 0.02 M Tris buffered saline, pH 8.0, containing 0.02% sodium azide (see MSDS*) as a preservative.

Specificity of the mouse IgA,\(\lambda\) is determined by Ouchterlony Double Diffusion (ODD).

Identity and purity of the antibody is established by immunoelectrophoresis (IEP). Electrophoresis of the purified immunoglobulin followed by diffusion versus anti-mouse whole serum and anti-mouse IgA results in single arcs of precipitation.

Precautions
*Due to the sodium azide content a material safety data sheet (MSDS) for this product has been sent to the attention of the safety officer of your institution. Consult the MSDS for information regarding hazards and safe handling practices.

Product Profile
Each vial contains at least 1 mg of purified myeloma protein. Protein concentration is 1.0 mg/ml as determined by the absorbance at 280nm \(\left(E^{1\%}_{280} = 14.0\right)\).

Polyacrylamide gel electrophoresis (PAGE) analysis of the purified IgA,\(\lambda\) shows two bands of protein (under reduced conditions) when stained using Reactive Blue R (Coomassie Blue).

Storage
The product may be stored frozen in working aliquots. Repeated freezing and thawing is not recommended.

Sigma brand products are sold through Sigma-Aldrich, Inc.
Sigma-Aldrich, Inc. warrants that its products conform to the information contained in this and other Sigma-Aldrich publications. Purchaser must determine the suitability of the product(s) for their particular use. Additional terms and conditions may apply. Please see reverse side of the invoice or packing slip.
