IODOACETAMIDE
Product Number I6125 AND I1149
Storage Temperature 2-8 °C

CAS #: 144-48-9
Synonyms: IAN; a-Iodoacetamide; Monoiodoacetamide; 2-Iodoacetamide; Surauto; USAF D-1

Product Description

Appearance: powder. Melting Point: 93°C-96°C Molecular Formula: C₂H₄INO
Formula Weight: 185.0

Some enzymes IAN reportedly inhibits (to varying extents) are: Acetoacetyl-CoA Thiolase; Adenylate Kinase; Alcohol Dehydrogenase (human liver); Aldehyde Dehydrogenase (0.1 mM, 40%); Alkaline Phosphatase (calf intestinal); d-Aminolevulinate Dehydratase; ß-Amylase (soybean); L-Arginine 2-Monoxygenase; Benzaldehyde Dehydrogenase 1 (0.5-10 mM); Calcium-Activated Protease (100 µM, 100%); Carbonic Anhydrase B (human); Cathepsin B (1 mM in the presence of 0.04 M cysteine); Cyclohexanone Oxygenase (5 mM, 67%); Dolichol Esterase; Formylmethionine Deformylase (10 mM, 80%); Galactose Oxidase (0.1 mM, 22%); Gamma-Glutamylcyclotransferase(1mM, 14%); Glutathione Thiol Esterase; Glutathione Thiol Esterase; Heme Oxygenase (5 mM, 39%); ß-Hydroxy-ß-Methylglutaryl Coenzyme A Reductase; 3-Ketoacyl-CoA-Thiolase (0.1 M, 84%); L-Lysine Decarboxylase (1 mM); L-ß-Lysine Mutase; Malate Dehydrogenase (porcine); NADPH-Linked a,ß-Ketoaldehyde Double Bond Reductase (1 mM, 37%); 6-Phosphogluconate Dehydrogenase (10 mM, 80%); Polyamine Oxidase; Prolidase; D-Proline Reductase; Prostate-specific Antigen; Prostate-specific Antigen; Prostate-specific Antigen; Prostate-specific Antigen; Prostate-specific Antigen; Prostate-specific Antigen; Polyamine Oxidase; Soluble Metalloendopeptidase; Thioesterase component from fatty acid synthetase multienzyme complex (I₅₀=100 µM); Thioltransferase; Transglutaminase (in the presence of Ca²⁺); Tryptophan Oxidative Decarboxylase (1 mM, 80%); Tryptophan Synthetase.

IAN may also inhibit bromelain, cathepsin C, clostripain and carboxypeptidase P since these enzymes are inhibited by sulfhydryl agents such as iodoacetic acid. IAN (irreversibly) inhibited the dephosphorylation of both epidermal growth factor receptor (EGFR) and platelet-derived growth factor receptor (PDGFR) presumably by alkylation at the active center of one or several protein tyrosine phosphatases in cell lines. IAN is an irreversible inhibitor of many cysteine proteases. However, it is not highly specific for the active site cysteine residue of proteases and can inhibit many enzymes. In the alkylation reaction, IAN reacts with histidine (such as in RNase), methionine and sulfhydryl groups of many proteins. IAN can react with low molecular weight thiol compounds such as mercaptoethanol and glutathione. The reaction of IAN with glutathione was utilized in a titration method for the determination of sulfhydryl groups in different compounds. The alkylation reaction forms stable protein derivatives which will remain intact during further study of the protein. Sigma Prod. No. I6125 is reagent grade. Product no. I1149 has been additionally tested for trace metal content.
Preparation Instructions

IAN is soluble in water; a suggested stock solution is 10-100 mM. The effective concentrations for use as a protease inhibitor are 10-100 μM. All solutions are sensitive to light and should be freshly prepared.¹
