Boron Reagents for Suzuki Coupling

Borylation Reagents

Boronic Acids

Boronate Esters

Trifluoroborate Salts

With a Special Foreword
by Prof. Akira Suzuki

Table of Contents

Sigma-Aldrich is committed to providing the most extensive portfolio of high-quality boronic acids, boronate esters, and trifluoroborate salts for use in Suzuki coupling, and we continually expand our product listing. Within each section of this directory, products are listed by increasing molecular formula. If you are unable to find a coupling reagent for your research, "Please Bother Us" at nwallock@sial.com, or contact your local Sigma-Aldrich office. (see back cover)

Borylation Reagents

Boronic Acids

Alkylboronic acids
Alkenylboronic acids
Arylboronic acids
N-Heteroarylboronic acids
O-Heteroarylboronic acids
S-Heteroarylboronic acids

Boronate Esters

Alkylboronate esters
Alkenylboronate esters
Alkynylboronate esters
Arylboronate esters
N-Heteroarylboronate esters
O-Heteroarylboronate esters
S-Heteroarylboronate esters

Trifluoroborate Salts

Alkyltrifluoroborates
Alkenyltrifluoroborates
Aryltrifluoroborates
S-Heteroaryltrifluoroborates

Foreword

Akira Suzuki
Professor Emeritus, Hokkaido University
Sapporo, Japan

Reactions in which new carbon-carbon bonds are formed are key steps in building the complex, bioactive molecules that become developed into drugs and agrochemicals. These reactions are also vital in developing the new generation of ingeniously-designed organic materials with novel electronic, optical, or mechanical properties, that are likely to play a significant role in the burgeoning area of nanotechnology.

During the past 40 years, the most important carbon-carbon bond-forming methodologies have involved the use of transition metals to mediate the reactions in a controlled and selective manner. Perhaps the most widely used of these chemistries is the cross-coupling reaction of various organoboron compounds with organic electrophiles catalyzed by a palladium complex. This reaction, Suzuki coupling, is now regarded as an integral part of innumerable synthetic routes used to build complex organic chemicals.

Suzuki coupling has many advantages. The reactants are readily available, nontoxic, and air- and water-stable. They react under mild conditions and are amenable to a variety of reaction conditions, including the use of aqueous solvents and substrate supports. The inorganic boron byproducts can be easily removed after completion of the reaction. Most important of all, the coupling proceeds with high regio- and stereoselectivity, and is little affected by steric hindrance. It does not affect other functional groups in the molecule, and can be used in one-pot strategies.

The reaction has proved to be extremely versatile. It was first carried out between alkenyl reactants, but over the years, the scope of the reaction has been extended to couple carbon atoms in aryl, alkyl, and alkynyl groups under a wide variety of conditions. Thus, the Suzuki coupling reaction is truly "carbon-carbon bond formation made easy."
