ProductInformation

Lectin-Agarose
from *Artocarpus integrifolia*

Product Number **L 5147**
Storage Temperature 2-8 °C

Product Description

Lectins are proteins or glycoproteins of non-immune origin that agglutinate cells and/or precipitate complex carbohydrates. Lectins are capable of binding glycoproteins even in presence of various detergents.[1] The agglutination activity of these highly specific carbohydrate-binding molecules is usually inhibited by a simple monosaccharide, but for some lectins, di, tri, and even polysaccharides are required.

Lectins are isolated from a wide variety of natural sources, including seeds, plant roots and bark, fungi, bacteria, seaweed and sponges, mollusks, fish eggs, body fluids of invertebrates and lower vertebrates, and from mammalian cell membranes. The precise physiological role of lectins in nature is still unknown, but they have proved to be very valuable in a wide variety of applications *in vitro*, including:

1. blood grouping and erythrocyte polyagglutination studies.
2. mitogenic stimulation of lymphocytes.
3. lymphocyte subpopulation studies.
4. fractionation of cells and other particles.
5. histochemical studies of normal and pathological conditions.

Sigma offers a range of lectins suitable for the above applications. Most Sigma lectins are highly purified by affinity chromatography, but some are offered as purified or partially purified lectins, suitable for specific applications.

Many of the lectins are available conjugated to (conjugation does not alter the specificity of the lectin):

1. fluorochromes (for detection by fluorimetry).
2. enzymes (for enzyme-linked assays).
3. insoluble matrices (for use as affinity media).

Please refer to the table for general information on the most common lectins.

This product is immobilized on crosslinked 4% beaded agarose. This resin has been used for the purification of proteins and glycopeptides bearing O-linked oligosaccharides.[2,3] The resin was used to bind two peptides from plasminogen and one from protein Z. The column was equilibrated with 100 mM tris, pH 7.0 with 500 mM NaCl. Bound peptides were eluted with 20 mM α-methylgalactopyranoside (Product No. M 1379) in the same buffer. Elution was also carried out with 100 mM melibiose (Product No. M 5500) in the same buffer.

This lectin-agarose resin has also been reported to be able to bind IgA. The loading buffer was 10 mM phosphate, pH 7.2 with 150 mM NaCl. Elution of bound IgA was with 800 mM D-galactose.[4]

Precautions and Disclaimer

For Laboratory Use Only. Not for drug, household or other uses.

Preparation Instructions

This agarose conjugate is a suspension in 1 M NaCl and 0.01% thimerosal. It should be centrifuged for 30 seconds at 1,000 x *g* to pellet the resin. The supernatant should then be discarded and replaced by binding buffer dictated by the experiment.

Storage/Stability

Aggregation is thought to occur in the presence of high concentrations of 2-mercaptoethanol.

Lectin	MW (kDa)	Subunits	Specificity		Mitogenic Activity
			Blood Group	Sugar	
Abrus precatorius			–		+
Agglutinin	134	4		gal	
Abrin A (toxin)	60	2		gal	
Abrin B (toxin)	63.8	2(αβ)		gal	
Agarius bisporus	58.5	–	–	β-gal(1→3)galNAc	
Anguilla anguilla	40	2	H	α-L-Fuc
