Collagenase P
from Clostridium histolyticum

Clostridiopeptidase A

Cat. No. 11 213 857 001 100 mg
Cat. No. 11 213 865 001 500 mg
Not available in US
Cat. No. 11 249 002 001 1 g
Available in US only
Cat. No. 11 213 873 001 2.5 g

Store lyophilizate at +2 to +8°C.

1.2. Storage and Stability

Storage Conditions (Product)
When stored at +2 to +8°C, the lyophilizate is stable through the expiration date printed on the label.

<table>

</tr>
</tbody>
</table>

Storage Conditions (Working Solution)
Store reconstituted solution at −15 to −25°C.

Reconstitution
Reconstitute Collagenase P in any balanced salt solution, such as HBSS (Hank's Balanced Salt Solution).
1. General Information

1.3. Additional Equipment and Reagent required

For preparation of the pancreas - Method I

See section, Working Solution for additional information.

- HBSS (Hank's Balanced Salt Solution)
- HEPES
- Washing solution
- Ficoll
- Culture medium: Medium RPMI 1640 containing 10% FCS.
- Water bath
- Centrifuge
- Filter, mesh size 600 μm

For isolation of single cells from islets

See section, Working Solution for additional information.

- HBSS (Ca²⁺/Mg²⁺-free)
- Trypsin solution
- Culture medium: Medium RPMI 1640 containing 10% FCS.
- BSA*
- 18-gauge cannula
- 20-gauge needle
- Centrifuge
- CO₂ incubator

For preparation of the pancreas - Method II

See section, Working Solution for additional information.

- Krebs-Ringer solution
- Water bath
- Stereo microscope

For additional isolation steps

- Ca²⁺-free Krebs-Ringer solution

1.4. Application

Collagenase P is an enzyme mixture used for the disaggregation of tissues and for the isolation of cells.

- Because of its high collagenase activity, the preparation is particularly suitable for the isolation of pancreatic islets. Each lot is tested for its suitability for the isolation of pancreatic islets from mouse or rat pancreas.
- This collagenase preparation is also suitable for the isolation of adipocytes from epididymal fat pads of rats.

Collagenase P is a non-sterile preparation of the culture supernatant of Clostridium histolyticum. It is neither designed nor intended for isolation of pancreatic islets for transplantation into humans and must not be used for such purposes.
2. How to Use this Product

2.1. Before you Begin

Working Solution

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Preparation of pancreas</td>
<td>• 8 g/l NaCl&lt;br&gt;• 0.4 g/l KCl&lt;br&gt;• 0.14 g/l CaCl₂&lt;br&gt;• 0.1 g/l MgSO₄ × 7 H₂O&lt;br&gt;• 0.15 g/l MgCl₂ × 6 H₂O&lt;br&gt;• 0.06 g/l Na₂HPO₄ × H₂O&lt;br&gt;• 0.06 g/l KH₂PO₄&lt;br&gt;• 1 g/l glucose&lt;br&gt;• 0.02 g/l phenol red&lt;br&gt;• 0.35 g/l NaHCO₃</td>
<td>Preparation of Collagenase solution.</td>
</tr>
</tbody>
</table>

Collagenase solution 0.5 to 1.5 mg/ml Collagenase P in HBSS containing 10 mM HEPES. The following quantities are used from this solution:
• 12 ml for a mouse pancreas
• 10 ml for a rat pancreas

The optimal concentration of each collagenase P lot must be determined individually.

Method I - Isolation of islets

| Washing solution | HBSS containing 10 mM HEPES and 5% FCS (fetal calf serum). | Step 3, 4, 8 |
| Ficoll gradient | 25% stock solution (Ficoll 400 in HBSS containing 10 mM HEPES) and 23%, 20%, and 11% dilutions. | Steps 6, 7 |
| Culture medium | Medium RPMI 1640 containing 10% FCS. | Step 9 |

Isolation of single cells from islets

| HBSS (Ca²⁺/Mg²⁺-free) | • 3 mM EGTA [Ethylenebis(oxyethylenenitrilo) tetraacetic acid]<br>• 20 mg/ml BSA (bovine serum albumin)<br>• 2.2 mg/ml glucose | Step 2 |
| Trypsin solution, 0.25% | 2.5 mg/ml in PBS (phosphate buffered saline). | Step 3 |
| Culture medium | Medium RPMI containing 10% FCS. | Steps 6, 7 |

Method II - Isolation of islets

| Krebs-Ringer solution | • 115 mM NaCl<br>• 4.7 mM KCl<br>• 2.56 mM CaCl₂<br>• 1.2 mM KH₂PO₄<br>• 1.2 mM MgSO₄ × 7 H₂O<br>• 20 mM NaHCO₃<br>• 16 mM HEPES | Step 1 |
2.2. Protocols

Preparation of the pancreas

1. Sacrifice the animal and open the abdomen.
2. Uncover the bile duct by displacing the duodenum and the liver.
3. Clamp off the bile duct at its entrance to the duodenum.
4. Free the upper part of the bile duct by dissection to the liver.
5. Bleed the animal completely by heart puncture.
6. Inject Collagenase solution through the common bile duct into the pancreas.
7. Distend the pancreas with the Collagenase solution.
8. Remove the distended pancreas.
9. Transfer the pancreas to a 5 cm petri dish (mouse) or 10 cm petri dish (rat).

Two possible working instructions for the isolation of pancreatic islets and islet cells are given below.

Method I - Isolation of islets

This method can be used to isolate islets and islet cells from mouse and rat pancreas. The islets are isolated by collagenase digestion and the isolation is accomplished using a Ficoll gradient. The islets can be subsequently dissociated into single cells.

1. Incubate for 45 to 50 minutes at +37°C in a water bath.
2. Pour the digested tissue into a 15 ml plastic tube; add approximately 10 ml Washing solution and suspend the tissue.
   Perform the following steps at +2 to + 8°C.
3. Centrifuge for approximately 1 minute at 250 × g.
   - Discard the supernatant and wash twice with Washing solution.
4. After the second washing step, discard the supernatant, resuspend in 5 ml Washing solution, and pass through a filter (mesh size 600 μm).
   - Wash again with 5 ml of solution.
   For rat pancreas, distribute the digested tissue in several plastic tubes to avoid overloading.
5. Centrifuge for approximately 1 minute at 250 × g.
   - Remove the supernatant completely.
6. Resuspend the pellet in 3 ml 25% Ficoll stock solution.
2. How to Use this Product

7 Load on top of the 3 ml 25% Ficoll suspension, a discontinuous density gradient of 23% (3 ml), 20% (2 ml), and 11% (2 ml) Ficoll solutions.
   - Centrifuge for approximately 10 minutes at 800 × g.
   - The islets are found at the interface of 11% and 20% after the centrifugation. Some islets are at the interface of 20% and 23% (Fig. 1).

8 Wash the islets obtained from the upper two interfaces three times in Washing solution (centrifuge for 1 minute at 250 × g).
   - Resuspend pellet in 2 ml Washing solution.

9 Hand pick the islets and resuspend in culture medium.

Fig. 1: Concentration of islets.

**Isolation of single cells from islets**

1 Centrifuge islets in culture medium for 5 minutes at 250 × g.

2 Discard supernatant and resuspend the pellet in 3 ml HBSS containing EGTA, BSA, and glucose.

3 Add 100 μl trypsin solution.
   - Incubate for 10 minutes at +37°C and 5% CO₂.

4 Aspirate the islets 3 to 5 times through an 18-gauge cannula and transfer the cell suspension using a 20-gauge needle to another plastic tube containing 5 ml culture medium.

5 Centrifuge for 10 minutes at 250 × g.

6 Wash twice with culture medium.

7 Resuspend the pellet in culture medium.
Method II - Isolation of islets

This method can also be used to isolate islets from mouse and rat pancreas.

1. Place the pancreas in a petri dish containing 5 ml (rat) or 2 ml (mouse) Krebs-Ringer solution.

2. Cut the pancreatic tissue into small pieces using scissors for approximately 1 minute.

3. Transfer the Krebs-Ringer solution with the minced tissue to an appropriate glass vial into which the necessary amount of Collagenase P has already been introduced. For example, 1 mg for a mouse pancreas or 4 to 5 mg for a rat pancreas, depending on the size of the organ.

4. Incubate the vial at +37°C in a water bath for a certain period of time, typically approximately 12 minutes, with rapid shaking (300 cycles/minute).

5. Shake the vial by hand, typically 10 to 60 seconds until the solution appears homogeneous.

6. Add 10 ml Krebs-Ringer solution and shake the solution again.

7. Allow the islets to settle for 3 minutes and remove the supernatant. - Fill the vial again with Krebs-Ringer solution and resuspend.

8. Transfer the suspension to a petri dish and pick the isolated pancreatic islets under a stereo microscope using an Eppendorf pipette.

Additional isolation steps

Single cells can be isolated from these pancreatic islets in an additional step. If the islets are overdigested by the collagenase treatment, single cells can simply be isolated by vortexing in Ca²⁺-free Krebs-Ringer solution. If the islets are not overdigested, the cell isolation has to be performed using trypsin (see Method I).

2.3. Parameters

Biological Activity

Tested for the isolation of pancreatic islets from mouse and rat pancreas.

EC-Number

EC 3.4.24.3

Specific Activity

>1.5 U/mg lyophilizate (collagenase activity)

The preparation contains other enzyme activities, from which the following are routinely measured for each lot:

<table>
<thead>
<tr>
<th>Enzyme</th>
<th>Proteolytic activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clostripain activity</td>
<td>1 U catalyzes the hydrolysis of 1 μmol N-α-benzoyl-L-arginine ethyl ester (BAEE) per minute at +25°C and pH 7.6 after activation with 1 mM calcium acetate and 2.5 mM dithiothreitol.</td>
</tr>
<tr>
<td>Tryptic activity</td>
<td>With BAEE as substrate: 1 U is that enzyme activity which hydrolyzes 1 μmol BAEE in 1 minute at +25°C and pH 7.6.</td>
</tr>
<tr>
<td>Protease activity</td>
<td>1 U is that protease activity which is causing an absorption increase of 0.001 in 1 minute at +25°C in the standard azocoll test.</td>
</tr>
</tbody>
</table>
Unit Definition

1 U is the activity which liberates in 1 minute at +25°C, 1 μmol 4-phenyl-azobenzyl-oxycarbonyl-L-prolyl-L-leucine from 4-phenyl-azobenzyl- oxycarbonyl-L-prolyl-L-leucyl-glycyl-L-prolyl-D-arginine (substrate according to Wünsch) under assay conditions (Wünsch E, Heidrich HG, 1963).

Working Concentration

Isolation of pancreatic islets from mouse and rat pancreas: 0.5 to 1.5 mg/ml
Isolation of adipocytes: approximately 2 mg/ml

Refer to the Certificate of Analysis for the lot-specific concentration and additional lot-specific information.
3. Additional Information on this Product

3.1. Test Principle

Preparation
Collagenase P is prepared from the extracellular culture filtrate of a special *Clostridium histolyticum* strain. **Collagenase P is a research biochemical and is not manufactured under the US Good Manufacturing Practices (GMP) regulations.**

3.2. References

3.3. Quality Control

Each lot of Collagenase P is tested for its specific activity according to Wünsch and for additional enzyme activities (clostripain, tryptic activity, and protease activity). Furthermore, each lot is tested for functionality with pancreatic cells.
