**Product Information**

**Galactose and Lactose Colorimetric/Fluorometric Assay Kit**

Catalog Number **MAK011**

Storage Temperature –20 °C

**TECHNICAL BULLETIN**

**Product Description**

Lactose is a disaccharide containing one galactose and one glucose molecule. Lactose is the major sugar in the milk of most species, typically present between 2–8%. The enzyme lactase hydrolyzes lactose to its constituent monosaccharides. Galactose is a simple monosaccharide that serves as an energy source and as an essential component of glycolipids and glycoproteins. Galactose contributes to energy metabolism via its conversion to glucose by the enzymes that constitute the Leloir pathway. Defects in the genes encoding these proteins leads to the metabolic disorder galactosemia.

In this assay kit, galactose is oxidized by galactose oxidase resulting in a colorimetric (570 nm)/fluorometric ($\lambda_{ex} = 535$ nm/$\lambda_{em} = 587$ nm) product, proportional to the galactose present. To detect lactose, lactose is hydrolyzed by lactase to generate free galactose, which is then measured (total galactose). The lactose level is equal to total galactose minus free galactose.

This kit is suitable for use with various biological samples including serum, plasma, other body fluids, food, and growth media. This kit has a linear detection range of 0.2–1.0 nmole galactose for the fluorometric assay and 2–10 nmoles galactose for the colorimetric assay.

**Components**

The kit is sufficient for 100 assays in 96 well plates.

**Reagents and Equipment Required but Not Provided.**

- 96 well flat-bottom plate – It is recommended to use black plates with clear bottoms for fluorescence assays and clear plates for colorimetric assays.
- Fluorescence or spectrophotometric multiwell plate reader.

**Precautions and Disclaimer**

For R&D use only. Not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

**Preparation Instructions**

Allow reagents to come to room temperature and briefly centrifuge vials before opening. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

Galactose Assay Buffer – Allow buffer to come to room temperature before use.

Galactose Probe – Ready-to-use as supplied. Allow probe to come to room temperature before use. Store protected from light and moisture at –20 °C. Use within 2 months. Upon thawing, the Galactose Probe is ready-to-use in the colorimetric assay.

For the fluorescence assay, dilute an aliquot of the Galactose Probe Solution 5 to 10-fold with Galactose Assay Buffer, just prior to use. This will reduce the background of the fluorescence assay.
Lactase, Galactase Enzyme Mix, Horseradish Peroxidase – Reconstitute each in 220 µL Galactose Assay Buffer. Mix well by pipetting, then aliquot each and store, protected from light, at –20 °C. Use within 2 months of reconstitution.

Storage/Stability
The kit is shipped on wet ice. Storage at –20 °C, protected from light, is recommended.

Procedure
All samples and standards should be run in duplicate.

Galactose Standards for Colorimetric Detection
Note: Prepare the diluted standard fresh and do not store.

Immediately prior to use, dilute 10 mL of the 100 mM (100 nmole/mL) Galactose Standard Solution with 990 mL of Galactose Assay Buffer to prepare a 1 mM (1 nmole/mL) standard solution. Mix well and add 0, 2, 4, 6, 8, and 10 µL of the 1 mM Galactose standard solution into a 96 well plate, generating 0 (assay blank), 2, 4, 6, 8, and 10 nmole/well standards. Add Galactose Assay Buffer to each well to bring the volume to 50 µL.

Galactose Standards for Fluorometric Detection
Prepare a 1 mM Galactose standard solutions as for the colorimetric assay. Dilute 20 µL of the 1 mM standard solution with 180 µL of Galactose Assay Buffer to generate a 0.1 mM (0.1 nmole/µL) standard solution. Add 0, 2, 4, 6, 8, and 10 µL of the 0.1 mM Galactose standard solution into a 96 well plate, generating 0 (assay blank), 0.2, 0.4, 0.6, 0.8, and 1.0 nmole/well standards. Add Galactose Assay Buffer to each well to bring the volume to 50 µL.

Sample Preparation
Liquid samples can be directly added to the wells. Milk typically contains between 2–8% lactose. Add 0.01–0.1 µL of milk samples to the wells. Bring all samples to a final volume of 50 µL with Galactose Assay Buffer.

For unknown samples, it is suggested to test several sample dilutions to ensure the readings are within the linear range of the standard curve.

Assay Reaction
Note: To detect lactose, prepare two wells for each sample. Add 2 µL of Lactase to one well to convert lactose to galactose and glucose (total galactose detection). Do not add lactase to the other well (free galactose detection). Incubate at 37 °C for 30 minutes.

1. Set up the Master Reaction Mix according to the scheme in Table 1. 50 µL of the Master Reaction Mix is required for each reaction (well).

Table 1. Master Reaction Mix

<table>
<thead>
<tr>
<th>Reagent</th>

<td>2 µL</td>
</tr>
<tr>
<td>Galactose Enzyme Mix</td>
<td>2 µL</td>
</tr>
<tr>
<td>HRP</td>
<td>2 µL</td>
</tr>
</tbody>
</table>

2. Add 50 µL of the Master Reaction Mix to each well containing the Galactose Standard and test samples. Mix well using a horizontal shaker or by pipetting, and incubate the reaction for 60 minutes at 37 °C. Protect the plate from light during the incubation.

3. For colorimetric assays, measure the absorbance at 570 nm ($A_{570}$). For fluorometric assays, measure fluorescence intensity ($\lambda_{ex} = 535/\lambda_{em} = 590$ nm).
Results

Calculations
The background for the assays is the value obtained for the 0 (assay blank) Galactose Standard. Correct for the background by subtracting the 0 (assay blank) value from all readings. Background values can be significant and must be subtracted from all readings. Use the values obtained from the appropriate Galactose standards to plot a standard curve.

Note: A new standard curve must be set up each time the assay is run.

Concentration of Galactose

\[ \frac{S_a}{S_v} = C \]

\( S_a \) = Amount of Galactose in unknown sample (nmole) from standard curve
\( S_v \) = Sample volume (\( \mu \)L) added into the wells
\( C \) = Concentration of Galactose in sample

Sample Calculation

Amount of Galactose \((S_a) = 5.84 \text{ nmole}\) (from standard curve)
Sample volume \((S_v) = 50 \ \mu \text{L}\)

Molecular weight of galactose = 180.16

Concentration of Galactose in sample

\[
\frac{5.84 \text{ nmole}}{50 \ \mu \text{L}} = 0.1168 \text{ nmole/\(\mu\)L}
\]

\[
0.1168 \text{ nmole/\(\mu\)L} \times 180.16 \text{ ng/nmole} = 21.04 \text{ ng/\(\mu\)L}
\]

Lactose = Total Galactose – Free Galactose
