Product Information

Lactate Dehydrogenase Activity Assay Kit

Catalog Number MAK066
Storage Temperature –20 °C

TECHNICAL BULLETIN

Product Description
Lactate dehydrogenase (LDH) is an oxidoreductase enzyme that catalyses the interconversion of pyruvate and lactate. Cells release LDH into the bloodstream after tissue damage or red blood cell hemolysis. Since LDH is a fairly stable enzyme, it has been widely used to evaluate the presence of damage and toxicity of tissue and cells. LDH is also elevated in certain pathological conditions such as cancer. Quantification of LDH has a broad range of applications.

The LDH Activity Assay kit quantifies LDH activity in variety of biological samples. The assay is quick, convenient, and sensitive. In this kit, LDH reduces NAD to NADH, which is specifically detected by colorimetric (450 nm) assay.

Components
The kit is sufficient for 500 assays in 96 well plates.

LDH Assay Buffer
Catalog Number MAK066A
50 mL

LDH Substrate Mix
Catalog Number MAK066B
1 vial

NADH Standard, 0.5 μmole
Catalog Number MAK066C
1 vial

LDH Positive Control
Catalog Number MAK066D
1 vial

Reagents and Equipment Required but Not Provided.
• 96 well flat-bottom plate – It is recommended to use clear plates for colorimetric assays.
• Spectrophotometric multiwell plate reader.

Precautions and Disclaimer
This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Preparation Instructions
Briefly centrifuge vials before opening. Use ultrapure water for the preparation of reagents. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

LDH Assay Buffer – Allow buffer to come to room temperature before use.

LDH Substrate Mix – Reconstitute in 1 mL of water. Mix well by pipetting and keep cold while in use.
Substrate Mix is stable for one week at 4 °C and 1 month at –20 °C.

1.25 mM NADH Standard – Reconstitute in 400 μL of water to generate 1.25 mM standard solution. Mix well by pipetting and keep cold while in use. The NADH standard solution is stable for one week at 4 °C and 1 month at –20 °C.

LDH Positive Control – Reconstitute in 200 μL of LDH Assay Buffer before use. Use 2–5 μL of the prepared LDH Control as positive control. Keep on ice when using.

Storage/Stability
The kit is shipped on wet ice. Storage at –20 °C, protected from light, is recommended.
**Procedure**

All samples and standards should be run in duplicate.

**NADH Standards for Colorimetric Detection**

Add 0, 2, 4, 6, 8, and 10 µL of the 1.25 mM NADH Standard in duplicate into a 96 well plate, generating 0 (blank), 2.5, 5, 7.5, 10, and 12.5 nmole/well standards. Add LDH Assay Buffer to a final volume of 50 µL.

**Sample Preparation**

Tissue (100 mg), cells (1 x 10^6), or erythrocyte (200 µL) samples should be rapidly homogenized on ice in 500 µL of cold LDH Assay buffer. Centrifuge at 10,000 x g for 15 minutes at 4 °C to remove insoluble material. Use soluble fraction for assay. Serum samples may be assayed directly. Add 2–50 µL samples into duplicate wells of a 96 well plate. Bring samples to a final volume of 50 µL with LDH Assay Buffer.

For unknown samples, it is suggested to test several sample dilutions to ensure the readings are within the linear range of the standard curve.

**Assay Reaction**

1. Set up the Master Reaction Mix according to the scheme in Table 1. 50 µL of the Master Reaction Mix is required for each reaction (well).

<table>

</tr>
</thead>
<tbody>
<tr>
<td>LDH Assay Buffer</td>
<td>48 µL</td>
</tr>
<tr>
<td>LDH Substrate Mix</td>
<td>2 µL</td>
</tr>
</tbody>
</table>

2. Add 50 µL of the Master Reaction Mix to each of the wells. Mix well using a horizontal shaker or by pipetting. Protect the plate from light during the incubation.

3. After 2–3 minutes, take the initial measurement (T_{initial}). Measure the absorbance at 450 nm at the initial time (A_{450})_{initial}. **Note:** It is essential (A_{450})_{initial} is in the linear range of the standard curve.

4. Incubate the plate at 37 °C taking measurements (A_{450}) every 5 minutes. Protect the plate from light during the incubation.

5. Continue taking measurements until the value of the most active sample is greater than the value of the highest standard (12.5 nmole/well). At this time the most active sample is near or exceeds the end of the linear range of the standard curve.

6. The final measurement [(A_{450})_{final}] for calculating the enzyme activity would be penultimate reading or the value before the most active sample is near or exceeds the end of the linear range of the standard curve, see step 5. The time of the penultimate reading is T_{final}. **Note:** It is essential the final measurement falls within the linear range of the standard curve.
Results

Calculations
Correct for the background by subtracting the final measurement \( [(A_{450})_{\text{final}}] \) obtained for the 0 (blank) NADH standard from the final measurement \( [(A_{450})_{\text{final}}] \) of the standards. Background values can be significant and must be subtracted from all readings. Plot the NADH standard curve.

Note: A new standard curve must be set up each time the assay is run.

Calculate the change in measurement from \( T_{\text{initial}} \) to \( T_{\text{final}} \) for the samples.

\[ \Delta A_{450} = (A_{450})_{\text{final}} - (A_{450})_{\text{initial}} \]

Compare the \( \Delta A_{450} \) of each sample to the standard curve to determine the amount of NADH generated by the assay between \( T_{\text{initial}} \) and \( T_{\text{final}} \) (B).

The LDH activity of a sample may be determined by the following equation:

\[
\text{LDH Activity} = \frac{B}{(\text{Reaction Time}) \times V} \times \text{Sample Dilution Factor}
\]

\( B \) = Amount (nmole) of NADH generated between \( T_{\text{initial}} \) and \( T_{\text{final}} \).

Reaction Time = \( T_{\text{final}} - T_{\text{initial}} \) (minutes)

V = sample volume (mL) added to well

LDH activity is reported as nmole/min/mL = milliunit/mL

One unit of LDH activity is defined as the amount of enzyme that catalyzes the conversion of lactate into pyruvate to generate 1.0 \( \mu \)mole of NADH per minute at 37 °C.

Example:
NADH amount (B) = 5.84 nmole
First reading (\( T_{\text{initial}} \)) = 3 minute
Second reading (\( T_{\text{final}} \)) = 32 minutes
Sample volume (V) = 0.01 mL
Sample dilution is 1

LDH activity is:

\[
\frac{5.84}{(32 - 3) \times 0.01} = 20.14 \text{ milliunits/mL}
\]
