Creatinine Assay Kit

Catalog Number MAK080
Storage Temperature –20 °C

**Product Description**
Creatinine is generated from creatine by nonenzymatic dehydration. Creatinine is produced at a constant rate and is excreted from the body through kidney glomerular filtration. Decreased kidney function can affect the rate at which creatinine is filtered by the kidneys and can be used as a measure of kidney function. Decreased kidney function can result in increased serum creatinine levels due to the inability to clear creatinine through urine excretion. Creatinine levels can be affected by changes in muscle mass, pregnancy, or the use of angiotensin inhibitors or angiotensin receptor antagonists.

In this assay, creatinine concentration is determined by a coupled enzyme reaction, which results in a colorimetric (570 nm)/fluorometric (\(\lambda_{ex} = 535/\lambda_{em} = 587\)) nm) product, proportional to the creatinine present. This kit is suitable for use with cell and tissue culture supernatants as well as serum, plasma, urine, and other biological fluids.

**Components**
The kit is sufficient for 100 assays in 96 well plates.

- **Creatinine Assay Buffer**
  Catalog Number MAK080A
  25 mL

- **Creatinine Probe, in DMSO**
  Catalog Number MAK080B
  0.2 mL

- **Creatinase**
  Catalog Number MAK080C
  1 \(\mu\)L

- **Creatinase**
  Catalog Number MAK080D
  1 \(\mu\)L

- **Creatinine Enzyme Mix**
  Catalog Number MAK080E
  1 \(\mu\)L

- **Creatinine Standard, 10 \(\mu\)mole**
  Catalog Number MAK080F
  1 \(\mu\)L

**Reagents and Equipment Required but Not Provided.**
- 96 well flat-bottom plate – It is recommended to use black plates with clear bottoms for fluorescence assays and clear plates for colorimetric assays.
- Fluorescence or spectrophotometric multiwell plate reader
- 10 kDa Molecular Weight Cut-Off (MWCO) Spin Filter

**Precautions and Disclaimer**
For R&D use only. Not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

**Preparation Instructions**
Briefly centrifuge vials before opening. Use ultrapure water for the preparation of reagents. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

Creatinine Assay Buffer – Allow buffer to come to room temperature before use.

Creatinine Probe – Thaw completely at room temperature to melt frozen DMSO prior to use. Aliquot and store protected from light and moisture at –20 °C. Upon complete thawing, the Creatinine Probe is ready-to-use in the colorimetric assay. **Note:** It is advised to centrifuge the vial to consolidate the material after thawing.

For the fluorescence assay, dilute an aliquot of the Creatinine Probe 5 to 10-fold with Creatinine Assay Buffer, just prior to use. This will reduce the background of the fluorescence assay.

Creatinase, Creatinase, and Creatinine Enzyme Mix – Reconstitute each with 220 \(\mu\)L of Creatinine Assay Buffer. Mix well by pipetting, then aliquot and store, protected from light, at –20 °C. Use within 2 months of reconstitution and keep cold while in use.
Creatinine Standard – Reconstitute in 100 μL of water to generate a 100 mM (100 nmole/μL) Creatinine Standard solution. Mix well by pipetting, then aliquot and store at -20 °C. Use within 2 months of reconstitution and keep cold while in use.

Storage/Stability
The kit is shipped on wet ice. Storage at -20 °C, protected from light, is recommended.

Procedure
All samples and standards should be run in duplicate.

Creatinine Standards for Colorimetric Detection
Dilute 10 μL of the 100 mM (100 nmole/μL) Creatinine Standard Solution with 990 μL of Creatinine Assay Buffer to prepare a 1 mM (1 nmole/μL) standard solution. Add 0, 2, 4, 6, 8, 10 μL of the 1 mM Creatinine standard solution into a 96 well plate, generating 0 (blank), 2, 4, 6, 8, and 10 nmole/well standards. Add Creatinine Assay Buffer to each well to bring the volume to 50 μL.

Creatinine Standards for Fluorometric Detection
Dilute 10 μL of the 100 mM (100 nmole/μL) Creatinine Standard Solution with 990 μL of Creatinine Assay Buffer to prepare a 1 mM (1 nmole/μL) standard solution. Dilute 10 μL of the 1 mM standard solution with 90 μL of water to generate a 0.1 mM (0.1 nmole/μL). Add 0, 2, 4, 6, 8, 10 μL of the 0.1 mM Creatinine standard solution into a 96 well plate, generating 0 (blank), 0.2, 0.4, 0.6, 0.8, and 1.0 nmole/well standards. Add Creatinine Assay Buffer to each well to bring the volume to 50 μL.

Sample Preparation
Tissue (10 mg) or cells (2 × 10⁶) should be rapidly homogenized in 4 volumes of cold Creatinine Assay buffer. Centrifuge at 13,000 × g for 10 minutes at 4 °C to remove insoluble material. High concentrations of proteins may interfere with the assay and should be removed with a 10 kDa MWCO spin filter. The soluble fraction may be assayed directly.

Serum samples may be deproteinized with a 10 kDa MWCO spin filter. The soluble fraction may be assayed directly.

Bring samples to a final volume of 50 μL with Creatinine Assay Buffer.

For unknown samples, it is suggested to test several sample dilutions to ensure the readings are within the linear range of the standard curve.

Sarcosine and creatine present in the sample can generate background. To control for sarcosine and creatine background, include a blank sample for each sample by omitting the Creatininase in the Reaction Mix.

Compounds in the sample may interfere with the assay. To test for interference, samples can be spiked with a known amount of creatinine (1–10 nmole) and compared to unspiked samples to ensure readings are accurate.

Assay Reaction
1. Set up the Reaction Mixes according to the scheme in Table 1. 50 μL of the appropriate Reaction Mix is required for each reaction (well).

Table 1. Reaction Mixes

<td>2 μL</td>
</tr>
</tbody>
</table>

2. Add 50 μL of the appropriate Reaction Mix to each of the wells. Mix well using a horizontal shaker or by pipetting, and incubate the reaction for 60 minutes at 37 °C. Protect the plate from light during the incubation.

3. For colorimetric assays, measure the absorbance at 570 nm (A570). For fluorometric assays, measure fluorescence intensity (λex = 535/λem = 587 nm).
Results
Calculations
The background for the assays is the value obtained for the 0 (blank) Creatinine Standard. Correct for the background by subtracting the 0 (blank) value from all readings. Background values can be significant and must be subtracted from all readings. Use the values obtained from the appropriate Creatinine standards to plot a standard curve.

Note: A new standard curve must be set up each time the assay is run.

Subtract the blank sample value from the sample reading to obtain the corrected measurement. Using the corrected measurement, the amount of creatinine present in the sample may be determined from the standard curve:

Concentration of Creatinine
\[
\frac{S_a}{S_v} = C
\]

\( S_a \) = Amount of Creatinine in unknown sample (nmole)
from standard curve
\( S_v \) = Sample volume (µL) added into the wells
\( C \) = Concentration of Creatinine in sample

Creatinine molecular weight: 113.12 g/mole

Sample Calculation
Amount of Creatinine \( (S_a) = 5.84 \) nmole
(from standard curve)
Sample volume \( (S_v) = 50 \) µL

Concentration of Creatinine in sample
\[
\frac{5.84 \text{ nmole}}{50 \text{ µL}} = 0.1168 \text{ nmole/µL}
\]

\[
0.1168 \text{ nmole/µL} \times 113.12 \text{ ng/nmole} = 13.21 \text{ ng/µL}
\]
## Troubleshooting Guide
