Product Information

Cell-Based ELISA for detecting Phosphotyrosine in cultured cell lines
adequate for 96 assays (1 \( \times \) 96 well plate)

Catalog Number RAB0518
Storage Temperature \(-20^\circ C\)

TECHNICAL BULLETIN

Product Description
Protein phosphorylation is instrumental in the regulation of protein activity within a cell. It plays important roles in the living cells including proliferation, differentiation, and metabolism. A large number of protein kinases and phosphatases have been extensively investigated, and have been shown to be involved in signal transduction pathways.

The Cell-Based Phosphotyrosine ELISA kit is a very rapid, convenient, and sensitive assay kit that can monitor the activation or function of important biological pathways in cells. It can be used for measuring the relative amount of phosphotyrosine and screen the effects of various treatments, inhibitors (such as siRNA or chemicals), or activators in cultured human, mouse, and rat cell lines.

By determining phosphotyrosine proteins in the experimental model system, pathway activation can be verified in the cell line without spending time and effort in preparing cell lysate and performing a Western blot. In the Cell-Based Phosphotyrosine ELISA kit, cells are seeded into a 96 well tissue culture plate. The cells are fixed after various treatments, such as inhibitors or activators. After blocking, HRP-Anti-Phosphotyrosine is pipetted into the wells and incubated. The wells are washed again, a TMB substrate solution is added to the wells and color develops in proportion to the amount of protein. The Stop Solution changes the color from blue to yellow, and the intensity of the color is measured at 450 nm.

1. Add cells
2. Treatment with stimulators or inhibitors
3. Fixing and blocking
4. HRP-conjugated anti-phosphotyrosine antibody
5. Develop with substrate

*For up to 3 months (unless otherwise stated) or until expiration date.

### Reagents and Equipment Required but Not Provided.

1. A model cell line, protein tyrosine kinase inhibitors, growth factors, or cytokines.
2. Microplate reader capable of measuring absorbance at 450 nm.
3. 37 °C incubator.
4. Precision pipettes to deliver 2 μL to 1 mL volumes.
5. Adjustable 1-25 mL pipettes for reagent preparation.
6. 100 mL and 1 liter graduated cylinders.
7. Absorbent paper.
8. Distilled or deionized water.
9. Orbital shaker or oscillating rocker.

### Precautions and Disclaimer

This product is for Research Use Only. Not for Use in Diagnostic Procedures. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

### Storage/Stability

Upon receipt, the kit should be stored at –20 °C. Please use within 1 year from the date of shipment.

For storage of components after initial thaw, see Table 1.
Preparation Instructions

Note: Thaw all reagents to room temperature immediately before use. If wash buffers contain visible crystals, warm to room temperature and mix gently until dissolved.

Briefly centrifuge (~1,000 x g) Item G before opening to ensure maximum recovery.

Table 2.

HRP-anti-phosphotyrosine

2. Seed 100 μL of 10,000–30,000 cells into each well of a 96 well plate and incubate overnight at 37 °C and 5% CO₂.

*Note:* The optimal cell number used is dependent on the cell line and the relative amount of protein phosphorylation. More or less cells may be used.

Pre-coat the 96 well plate (Item A) by adding 100 μL of poly-L-lysine solution (Catalog Number P4832) into each well and then follow manufacturer’s instructions, if seeding HUVECs, HMEC-1, or other loosely attached cells. CellBIND® or poly-L-lysine treated tissue culture plates may be used.

The cells can be starved 4–24 hours dependent on the cell line prior to treatment with inhibitor or activator.

3. Apply various treatments, inhibitors (such as siRNA or chemicals) or activators according to manufacturer’s instructions and incubate. Discard the cell culture medium and wash 3 times with prepared 1x Wash Buffer A (200 μL each). Discard Wash Buffer and then tap the plate upside down to remove all of excess wash buffer.

*Note:* Dissolve the inhibitors or activators into serum free cell culture medium and then treat the cells according to manufacturer’s instructions.

To avoid cell loss, do not dispense liquid directly onto the cell surface. Instead, gently touch the pipette tip to the side of the well and gently dispense the liquid down the wall of cell culture wells.

Flip the plate over a proper receptacle to remove Wash Buffer A and then tap the plate gently onto a paper towel to remove any remaining liquid. Avoid the use of vacuum suction to remove solutions from the plate.
4. Add 100 μL of Fixing Solution (Item D) into each well and incubate for 20 minutes at room temperature with shaking. The fixing solution is used to permeabilize the cells.

5. Wash the plate 3 times with 1x Wash Buffer A (200 μL each), then tap the plate upside down to remove all of wash buffer.

6. Add 200 μL of prepared 1x Quenching Buffer (Item E) and incubate 20 minutes at room temperature. The quenching buffer is used to minimize the background response.

7. Wash the plate 4 times with 1x Wash Buffer A (200 μL each), then tap the plate upside down to remove all of wash buffer.

8. Add 200 μL of prepared 1x Blocking Solution (Item F) and incubate for 1 hour at 37 °C.

9. Wash 3 times with prepared 1x Wash Buffer B (200 μL each), then tap the plate upside down to remove all of excess wash buffer.

Note: The plate may be stored at −70 °C for several days.

10. Add 100 μL of 1x HRP-Conjugated Phospho-tyrosine-specific Antibody (Item G) to the corresponding well and incubate for 1 hour at room temperature with shaking.

11. Wash 4 times with 1x Wash Buffer B (200 μL each), then tap the plate upside down to remove all of excess wash buffer.

12. Add 100 μL of TMB Substrate Reagent (Item J) to each well and incubate for 30 minutes with shaking at room temperature in the dark.

13. Add 50 μL of Stop Solution (Item K) to each well and read at 450 nm, measure OD immediately.

Results
Representative results are shown:

Note:
1. In Procedure, step 2, A431 cells were seeded into appropriate wells of the microplate. Cells were incubated at 37 °C in 5% CO₂ overnight. The cells were starved overnight before treatment (inhibitor or activator).

2. The cells were treated for 30 minutes with 50 μL of 100 mM Genistein or 2 mM Lavendustin in appropriate wells at room temperature prior to EGF stimulation.

3. Added 50 μL of different concentrations of stimulators (rhEGF concentration for A431 cells: 0, 20, or 100 ng/mL in serum free DMEM) to appropriate wells (see Figure 3). Then incubated for 10, 20, or 30 minutes at 37 °C.

4. Discarded the solution and washed 3 times with 1x Wash Buffer A (200 μL each) immediately. Then tapped the plate upside down to remove all of excess wash buffer and followed with Procedure, steps 4–15.

Figure 3.
A431 cells were stimulated by different concentrations of EGF.
