60615 Kanamycin Sulfate

Product Description:
Molecular Formula: \( \text{C}_{18}\text{H}_{36-37}\text{N}_{4.8}\text{O}_{10-11} \cdot \text{H}_{2}\text{SO}_{4} \)
Molecular Weight: 582.6 g/mol
CAS Number: 70560-51-9
Mixture of Kanamycin A (main component) and Kanamycin B and C.

Cross-resistance occurs between kanamycin and neomycin, framycetin, and paromomycin, and partial cross-resistance has been reported between kanamycin and streptomycin.¹

This product can be put into agar (agar plate), and the plate should be then be sealed to prevent any evaporation of moisture from the agar. The sealed plate can be stored at 2-8 °C for about one month. If the plate is not sealed to prevent evaporation of moisture, the kanamycin can degrade.

Precautions and Disclaimer:
For Laboratory Use Only. Not for drug, household or other uses.

Preparation Instructions:
Kanamycin sulfate is soluble 1 in 8 part of water, but practically insoluble in alcohol, acetone, chloroform, ether, and ethyl acetate.
A 1% solution in water has a pH of 6.5 to 8.5. This is in contrast to the pH of 5.5 to 7.5 for a 1% solution in water of kanamycin acid sulfate.¹
This product is soluble at 50 mg/ml in water yielding a clear, colorless to faint yellow solution.

Storage/Stability:
Solutions of kanamycin monosulfate may be autoclaved. Tissue culture grade kanamycin sulfate solutions are filtered through a 0.2 µm filter, and it is recommended to store these solutions at 2-8 °C for long-term storage.
