MONOCLONAL ANTI-HUMAN FIBRONECTIN
CLONE IST-3
Mouse Ascites Fluid

Product No.  F 0791

Product Description
Monoclonal Anti-Human Fibronectin (mouse IgG1 iso-type) is derived from the IST-3 hybridoma produced by the fusion of mouse myeloma cells and splenocytes from BALB/c immunized mice. Purified human plasma fibronectin was used as the immunogen.\textsuperscript{1,2} The isotype is determined using Sigma ImmunoType™ Kit (Product Code ISO-1) and by a double diffusion immunoassay using Mouse Monoclonal Antibody Isotyping Reagents (Product Code ISO-2).

Monoclonal Anti-Human Fibronectin, clone IST-3, recognizes an epitope located within the fourth type-three repeat of human plasma fibronectin. The antibody localizes plasma and cellular fibronectin both in its natural and denatured-reduced forms (240 kDa) using immunoblotting,\textsuperscript{1} RIA,\textsuperscript{1,2} ELISA, immunocytochemistry and immunohistochemistry. It may be used for the specific labeling of fibronectin in cultured cells and in frozen tissue sections. Staining of formalin-fixed, paraffin-embedded sections may require prolonged proteolytic unmasking (e.g., by trypsin). The product cross-reacts with goat, sheep, bovine, dog, rabbit and chicken fibronectin.

Monoclonal Anti-Human Fibronectin may be used for the localization of fibronectin using various immunochemical assays including ELISA, immunoblot, dot blot, RIA, immunocytochemistry and immunohistochemistry.

Fibronectin (FN)\textsuperscript{3-5} is an extracellular matrix protein composed of two nearly-identical disulfide-bound polypeptides with typical molecular weights of 220-280 kDa. Cellular fibronectin is structurally and antigenically similar to cold insoluble globulin from plasma and antibodies to either form usually cross-react. Careful analysis of the FN molecule indicates that it contains several functionally and structurally distinct domains which may bind to cell surfaces and to a variety of molecules such as collagen, heparin, gelatin, fibrin and DNA. Human fibronectin is composed of at least five distinct domains that are referred to as Hep-1/Fib-1, Gel, Cell, Hep-2 and Fib-2, based on their affinity for heparin (Hep), gelatin (Gel), the cell surface (Cell) or fibrin (Fib). These domains are aligned from the NH\textsubscript{2} to the COOH terminus in the above order and can be separated from each other by mild proteolytic digestion.\textsuperscript{6} Because of their multiple interactions, FN’s play an important role in diverse biological phenomena including cell adhesion, cell migration, hemostasis and thrombosis, wound healing and the ability to induce a more normal phenotype in transformed cells. Upon malignant transformation many cells lose most of their surface bound FN.

Immunohistochemical experiments have shown the presence of cellular fibronectin in sections of human malignant tumors, indicating that at least part of the fibronectin in such tumors is not derived from the plasma, but is produced locally.\textsuperscript{6-8} Monoclonal antibodies reacting specifically with FN may be used to localize FN in human cell cultures, in tissue sections and in plasma, by immunoblotting and immunohistochemical techniques. They may also be used for immunoadfinity purification and immunoprecipitation of cellular fibronectin. In addition, these antibodies may be used to specifically modulate the functional activity of FN.

Reagents
The product is provided as ascites fluid containing 0.1% sodium azide as preservative.

Precautions
Due to the sodium azide content a material safety sheet (MSDS) for this product has been sent to the attention of the safety officer of your institution. Consult the MSDS for information regarding hazardous and safe handling practices.
Product Profile
The minimum antibody titer of 1:50 was determined by indirect immunofluorescent labeling of cultured human fibroblasts.

In order to obtain best results, it is recommended that each user determine the optimal working dilution for individual applications by titration assay.

Storage
For continuous use, store at 2-8 °C for up to one month. For extended storage freeze in working aliquots. Repeated freezing and thawing is not recommended. Storage in "frost-free" freezers is not recommended. If slight turbidity occurs upon prolonged storage, clarify the solution by centrifugation before use.
