Polynucleotide phosphorylase
human, histidine-tagged
recombinant, expressed in *Escherichia coli*

Catalog Number N1290
Storage Temperature –70 °C

EC 2.7.7.8
Synonyms: Polyribonucleotide nucleotidyltransferase, hPNPase

**Product Description**
Polynucleotide phosphorylase (PNPase) is a bifunctional enzyme with a phosphorolytic 3′ to 5′ exoribonuclease activity and a 3′-terminal oligonucleotide polymerase activity. It is also involved in mRNA processing and degradation in bacteria, plants, and humans.\(^1\) The human PNPase (hPNPase) was identified in an overlapping pathway screen to discover genes displaying coordinated expression as a consequence of terminal differentiation and senescence of melanoma cells.\(^2\) Recent studies show, unlike chloroplast and plant mitochondria in which the PNPase is located in the stroma and matrix, the human PNPase is mostly or exclusively located in the mitochondrial intermembrane space (IMS).\(^3-5\) The human PNPase exhibits a very similar structure to the bacterial enzyme. The subunit molecular mass of the human enzyme is ~90 kDa and the native protein is present as a multimeric complex.\(^6\)

hPNPase was co-purified with the RNA helicase hSUV3 suggesting participation of both proteins in mRNA metabolism. hPNPase was also purified as an interacting protein with TCL1, an oncoprotein promoting B and T cell malignancies and apoptotic stimuli.\(^4,7,8\) Given the above, hPNPase has a pleiotropic biological effect on mitochondrial homeostasis, cellular senescence, mtRNA poly(A) tail length alteration, and cell stress.\(^9-10\) Currently, efforts are directed towards understanding the regulation of hPNPase expression, its subcellular localization, and the mechanism(s) by which it performs its numerous cellular functions. In comparison with bacteria and chloroplast PNPase, hPNPase responds to much lower concentrations of P\(_i\), changing its mode of activity between degradation and polymerization. The specificity of the enzyme for polymerization is high for ADP, like that of the *E. coli* PNPase, with lower activity when incubated with other NDPs.

The product is supplied as a solution in 20 mM HEPES buffer, pH 7.9, with 0.1 mM EDTA, 2 mM DTT, 12.5 mM MgCl\(_2\), ~130 mM KCl, and 20% (w/v) glycerol.

**Purity:** ≥90% (SDS-PAGE)

**Specific activity:** ≥20 units/mg-protein

**Unit definition:** One unit will polymerize 1.0 µmole of ADP, releasing 1.0 µmole of inorganic phosphate in 15 minutes at pH 9.1 at 42 °C.

**Precautions and Disclaimer**
This product is for R&D use only, not for drug, household, or other uses. Please consult the Material Safety Data Sheet for information regarding hazards and safe handling practices.

**Storage/Stability**
Store the product at –70 °C. The product is stable for at least 2 years as supplied. Avoid repeated freezing and thawing. After initial thawing, the enzyme should be refrozen at –70 °C in aliquots.
