Sodium pyruvate

Product Number P 4562
Storage Temperature 2-8 °C

Product Description
Molecular Formula: C3H3NaO3
Molecular Weight: 110.0
CAS Number: 113-24-6
Synonyms: α-ketopropionic acid sodium salt, 2-oxopropanoic acid sodium salt, pyruvic acid sodium salt

This product is embryo tested (0.03 mg/ml) and is suitable for embryo research.

Pyruvate, the anion of pyruvic acid, is the end product of the glycolysis pathway, whereby glucose is converted to pyruvate with the production of ATP. In the mitochondria of aerobic organisms, pyruvate is converted to acetyl coenzyme A, which in turn is oxidized completely to CO2. When oxygen is not present in sufficient quantities, pyruvate is metabolized to lactate. In anaerobic organisms such as yeast, pyruvate is converted to ethanol. In gluconeogenesis, pyruvate is converted to glucose.1 Other metabolic fates of pyruvate include its conversion to alanine by transamination and to oxaloacetate by carboxylation.2

Sodium pyruvate is utilized as a component in culture broth and media.3,4 The use of sodium pyruvate in Wallen fermentation medium to enhance the conversion of oleic acid to 10-ketostearic acid by Bacillus sphaericus has been described.5 A protocol that uses sodium pyruvate to establish stably transfected human B cell lines has been published.6

Precautions and Disclaimer
For Laboratory Use Only. Not for drug, household or other uses.

Preparation Instructions
This product is soluble in water (100 mg/ml), yielding a clear, colorless solution.

Storage/Stability
Sterile filtered commercial solutions of sodium pyruvate are stable up to 24 months (100 mM, Product Number S 8636), when stored at 2-8 °C.

Pyruvic acid polymerizes and decomposes upon standing. It is advised to keep containers tightly sealed.7
