Trypsin from bovine pancreas
TPCK treated

Catalog Number T1426
Storage Temperature –20 °C

CAS RN 9002-07-05
EC 3.4.21.4
Molecular mass: 12.24 kDa
Extinction Coefficient: E1%1cm = 12.9–15.4 (280 nm)
Pt: 10.1–10.5
pH optimum: 6.7–9
Synonyms: Tryptase, Tryptar, Cocoonase, Parenzyme, Parenzymol

Product Description
Trypsin is a member of the serine protease family. The active site amino acid residues of trypsin include His46 and Ser183. Trypsin consists of a single chain polypeptide of 223 amino acid residues. Trypsin is produced by the cleavage of the N-terminal hexapeptide from its precursor, trypsinogen, at the Lys6–Ile7 bond. The amino acid sequence of trypsin is crosslinked by 6 disulfide bridges. This native form of trypsin is referred to as β-trypsin. Autolysis of β-trypsin by cleavage at its Lys131–Ser132 bond results in α-trypsin, which is held together by disulfide bridges.

Trypsin will cleave peptides on the C-terminal side of lysine and arginine amino acid residues. The rate of hydrolysis is slower if an acidic residue is on either side of the cleavage site and no cleavage occurs if a proline residue is on the carboxyl side of the cleavage site. Trypsin will also hydrolyze ester and amide linkages of synthetic derivatives of amino acids such as: benzoyl-L-arginine ethyl ester (BAEE), p-toluenesulfonyl-L-arginine methyl ester (TAME), tosyl-L-arginine methyl ester, Na-benzoyl-L-arginine p-nitroanilide (BAPNA), L-lysyl-p-nitroanilide, and benzoyl-L-arginamidase. Reported Km values are BAEE (0.05 mM), TAME (0.05 mM), and BAPNA (0.94 mM).

Assuming that the pH and temperature are the same and using a molar extinction coefficient of 808 at 254 nm for BAEE, the following conversions are valid:

1 BAEE μM Unit = 200 BAEE A253 Units
1 TAME μM Unit = 0.27 BAEE μM Units
1 BAEE μM Unit = 3.64 TAME Units
1 TAME μM Unit = 55 BAEE A253 Units
1 BAEE A253 Unit = 0.018 TAME μM Unit
1 TAME μM Unit = 180 TAME A253 Units
1 TAME A253 Unit = 0.33 BAEE Units
1 USP Unit = ΔA253 of 0.003 per minute
1 NF Unit = 3.3 A253 BAEE Units

The oxidized B chain of insulin is often used as a substrate to determine the suitability of trypsin for use in protein sequencing. The presence of two peptide bonds (Arg22–Gly23 and Lys29–Ala30) makes it an ideal peptide for use in this kind of application.

Serine protease inhibitors that will inhibit trypsin include DFP (diisopropyl fluorophosphate), TLCK (Nα-p-tosyl-L-lysine chloromethyl ketone), PMSF (phenylmethanesulfonyl fluoride), APMSF (4-amidinophenylmethanesulfonyl fluoride), AEBSF (4-(2-aminoethyl)benzenesulfonyl fluoride), aprotinin, leupeptin, α2-macroglobulin, α1-antitrypsin, α-aminobenzamidine, benzamidine (reversible), soybean trypsin inhibitor, lima bean inhibitor, bovine pancreas trypsin inhibitor, chicken egg white inhibitor, and turkey egg white inhibitor.

Electrospray mass spectrometry has been used to study the molecular mass of bovine trypsin. The crystal structure of bovine trypsin has been reported.

Precautions and Disclaimer
This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Preparation Instructions
This enzyme is soluble in 1 mM HCl (1 mg/ml).
Storage/Stability

Solutions in 1 mM HCl (pH 3) remain active for ~1 year when aliquoted and stored at –20 °C. The presence of calcium (20 mM) will also retard the autolysis of trypsin and maintain the stability of trypsin in solution.5,6

Trypsin retains most of its activity in 2.0 M urea, 2.0 M guanidine HCl, or 0.1% (w/v) SDS.14 Trypsin is reversibly denatured at high pH (above 11), by precipitation with TCA, or by high concentrations of urea (greater than 6.5 M).3 In order to abolish all trypsin activity, heating at 100 °C in 1% (w/v) SDS for 5 minutes is required.75

Procedure

For trypsin digestion of proteins, use a ratio (w:w) of 1:100 to 1:20 for trypsin:protein. Trypsin preparations usually contain some contaminating chymotrypsin. Thus this product has been treated with N-tosyl-L-phenylalanyl chloromethyl ketone (TPCK)16 to inhibit any chymotrypsin activity which may be present.
