Gasoline Oxygenate Reference Standards for ASTM Method D4815

Product Specification

These oxygenate reference standards are designed for use with ASTM Method D4815, a method for the determination of oxygenated compounds in reformulated fuels. ASTM D4815 is a dual column pneumatic switch analysis in which both polar and nonpolar columns are used. The fuel sample is first injected onto a polar column which retains oxygenated and high boiling compounds while venting interfering low boiling hydrocarbons. Following a pneumatic switching of the sample onto the nonpolar column, the oxygenate and high boiling compounds are separated. Detection is by flame ionization.

Along with valve timing and peak identification mixes, two sets of quantitative calibration mixes are available, both with and without internal standards. The internal standard-free mixes are packaged in quantities of 9.5mL to allow for the addition of the internal standard at point of use. Formulations containing the internal standard are packaged in 1mL quantities. All calibration blends are provided with a chromatogram and data verifying the purity and identity of the raw material.
