Instructions for Extended Length Control Knobs for Visidry™ SPE Drying Attachment

Catalog Number 57093

The extended length control knobs are necessary when using the Visidry Drying Attachment with a Visidry SPE vacuum manifold that is fitted with extended length flow control valves. The extended length control knobs are substituted for six of the standard length knobs on the drying attachment, positioned so that they interface with the six standard length flow control valves on the vacuum manifold top (see Figure 1).

Installation

1. Remove the standard length control knobs form the Visidry SPE Drying Attachment.

   **NOTE**
   A small screwdriver is helpful in removing the clip. Use it to push it one end of the clip while pushing the other end with your thumb or finger.

   a. Push simultaneously on the two open ends of the "C" shaped metal retaining clip located near the male luer end of each knob.
   b. Save the clips
   c. Remove the knob from the drying attachment plate by pulling up on the knurled portion of the knob with a gentle twisting motion.
   d. Repeat 1a through 1c for the other knobs to be replaced.

2. Install extended length control knobs.

   a. Insert extended length control knobs into each of the open holes and push the luer ends all the way through the drying attachment plate. A twisting motion may be necessary to get the rubber "O" rings on the knob into the plate.
   b. Secure each knob with a "C" shaped metal retaining clip. To attach the clips, place the open ends of each clip in the narrow groove near the male luer fitting of the knob. Then press on the back of the clip until it snaps into the groove around the knob.

3. The drying attachment is now ready for use.
