Supelco is a member of the Sigma-Aldrich family. Supelco products are sold through Sigma-Aldrich, Inc. Sigma-Aldrich warrants that its products conform to the information contained in this and other Sigma-Aldrich publications. Purchaser must determine the suitability of the product for a particular use. Additional terms and conditions may apply. Please see the reverse side of the invoice or packing slip.

This article is archived from a past issue of The Supelco Reporter. Information in the article was appropriate at the time of publication, but product specifications, catalog numbers, and availability may have changed over time.

If you have questions about applying methodology described in this article to a current application, please contact our technical service chemists.
The new Carboxen/polydimethylsiloxane SPME fiber retains small analytes, enabling detection at very low concentrations.

Extraction of small polar analytes from water samples is extremely difficult. Many commonly used extraction techniques are not suitable for polar compounds such as solvents. In liquid-liquid extraction and solid phase extraction, the solvents used in the process often are the same materials as the solvents being analyzed. With static and dynamic headspace extraction (purge and trap), some solvents of interest can be analyzed but, because of their solubility in water, they can be detected only to parts-per-million (ppm) concentrations.

Solid phase microextraction (SPME)* is a viable alternative to the traditional extraction techniques. SPME is fast, simple, and uses no solvents. SPME methods have been developed for analyzing a variety of samples and compounds with detection limits as low as parts-per-billion (ppb) concentrations.

We recently developed an SPME fiber with a Carboxen™/polydimethylsiloxane (PDMS) layer. This fiber is designed specifically for extraction of small, low molecular weight analytes at trace levels. Carboxen-1006** adsorbent is a highly porous carbon with a surface area of 1200 m²/g. The high porosity enables the fiber to strongly retain small analytes and provide a high sample capacity.

We used the Carboxen/PDMS fiber to extract solvents at 20ppb (Figure A). The fiber exhibited excellent extraction capability. Our sampling was by direct immersion for 10 minutes, but the extraction also can be accomplished using heated headspace at 50°C.

We compared with other SPME fibers, the Carboxen/PDMS fiber exhibits superior solvent recovery (Table 1). The small pores enable this fiber to extract analytes at higher orders of magnitude than other SPME fibers, including the more polar Carbowax®/divinylbenzene and polyacrylate fibers.

Figure A. Solvents in Water at 20ppb

Sample: solvents at 20ppb in 4mL water + 25% NaCl in 4mL vial
SPME Fiber: Carboxen/PDMS, 75µm film
Cat. No.: 57318
Extraction: direct immersion, 10 min, rapid stirring
Desorption: 3 min, 260°C
Column: SPB™-1 SULFUR, 30m x 0.32mm ID, 4.0µm film
Cat. No.: 24158
Oven: 50°C (2 min) to 150°C at 10°C/min
Carrier: helium, 30cm/sec
Injection: splitless (closed 2 min), 260°C, 0.75mm ID liner
Detector: FID

1. 8-/?-Dioxane
2. Ethanol
3. Acetonitrile
4. Acetone
5. Isopropanol
6. n-Propanol
7. Ethyl acetate
8. 3-Methyl-2-butanoane
9. 1,4-Dioxane
