

Product Information

**Membrane Scaffold Protein 1D1,
 Delta-Helix 5 Deleted
 recombinant, expressed in *E. coli*
 buffered aqueous solution**

Catalog Number **MSP15**
 Storage Temperature $-20\text{ }^{\circ}\text{C}$

Synonyms: MSP1D1 Δ H5

Product Description

Nanodisc technology is a widely applicable approach to render membrane proteins soluble in aqueous solutions in a native-like bilayer environment, where the membrane proteins remain stable and active.

The Nanodisc concept is derived from high density lipoprotein (HDL) particles and their primary protein component, apolipoprotein. The Nanodisc is a non-covalent structure of phospholipid bilayer and membrane scaffold protein (MSP), a genetically engineered protein, which mimics the function of Apolipoprotein A-1 (ApoA-1).^{1,2} A soluble Nanodisc assembles as the phospholipid forms a bilayer, which is encircled by two amphipathic MSP molecules that cover the hydrophobic alkyl chains of the bilayer. The length of the MSP controls the size of the Nanodisc structure.³

Incorporation of a membrane protein target into a Nanodisc is accomplished by first solubilizing the target protein in detergent, and then mixing with cholate-solubilized phospholipid and MSP. Removal of the detergents results in the assembly of the Nanodisc structure around the target protein (see Figure 1).

The resulting structure renders the protein soluble in a model membrane system of defined phospholipid content and size with a native-like bilayer. This provides stability and functional requirements for the protein target. The size of the Nanodisc, determined by the length of the MSP, allows control of the oligomerization state of the membrane protein.

Some examples of membrane-bound proteins incorporated into Nanodiscs are GPCRs,⁴ cytochromes P450,⁵⁻⁷ bacteriorhodopsin,⁸ coagulation factors,⁹ cholera toxin,¹⁰ and TAR receptor.¹¹

Figure 1.
 Example of a Nanodisc containing a 7-transmembrane protein

A critical component of Nanodiscs is the membrane scaffold protein (MSP), which forms the encircling amphipathic helical protein belt.^{12,13} The sequence similarities of MSPs to Apolipoprotein A-1 are presented in Figure 2.

Figure 2.
 Protein Maps of Apolipoprotein A-1 and MSP1D1 Δ H5

The first MSP, MSP1, was engineered with its sequence based on the sequence of A-1, but without the globular N-terminal domain of native A-1.¹⁴ The Membrane Scaffold Protein 1D1 (MSP1D1) variant of MSP1 deletes the first 11 amino acids in the Helix 1 portion (referred to as "H0.5" in Figure 2) of the original MSP1 sequence.³ The MSP1D1ΔH5 variant of MSP1D1 omits the 22 amino acids of the Delta-Helix 5 sequence (H5). The MSP1D1ΔH5 protein is also an N-terminal histidine-tagged protein with a TEV protease cleavage site between the histidine-tag and the protein sequence.

MSP1D1ΔH5 generates Nanodiscs that typically contain 120–160 lipid molecules and two MSPs per Nanodisc.³ The thickness of a Nanodisc is dependent on the type of phospholipid incorporated (typically 4.6–5.6 nm).³

This product is supplied as a buffered aqueous solution, at a protein concentration of ~5 mg/mL, and containing 20 mM Tris-HCl, pH 7.4, 100 mM NaCl, 0.5 mM EDTA, 5 mM sodium cholate, and 0.1% sodium azide.

Molecular mass: 22,105.7 Da (based on sequence)

Molecular mass of histidine-tag cleaved variant:
19,488.0 (based on sequence)

The MSP1D1ΔH5(-) protein concentration can be determined spectrophotometrically using the following extinction coefficients:

MSP1D1ΔH5(-), $\epsilon_{280} = 21,430 \text{ M}^{-1} \text{ cm}^{-1}$
Histidine-tag cleaved variant, $\epsilon_{280} = 18,450 \text{ M}^{-1} \text{ cm}^{-1}$
(Solvent: 20 mM Tris, pH 7.4, with 0.1 M NaCl, 0.5 mM EDTA, and 0.01% NaN_3)

Reagents Required, but Not Provided

- Sodium Cholate (Catalog No. C6445)
- Amberlite® XAD®-2 (Catalog No. 20275)
- Phospholipid(s)
 - 2-Oleoyl-1-palmitoyl-*sn*-glycero-3-phosphocholine (POPC, Catalog No. P3017)
 - 1,2-Dipalmitoyl-*rac*-glycero-3-phosphocholine (DPPC, Catalog No. P5911)
 - 1,2-Dimyristoyl-*rac*-glycero-3-phosphocholine (DMPC, Catalog No. P7930)
- Triton™ X-100 (optional, Catalog No. X100)
- Superdex® 200 (Catalog No. S6782)
or
Superdex 200 Increase 10/300 GL column (Catalog No. GE28-9909-44)

Precautions and Disclaimer

This product is for R&D use only, not for drug, household, or other uses. Please consult the Safety Data Sheet for information regarding hazards and safe handling practices.

Storage/Stability

Store this product at $-20 \text{ }^\circ\text{C}$. Working stock solutions of MSP1D1 can be stored at $2\text{--}8 \text{ }^\circ\text{C}$ for up to several days.¹⁶

Procedure

The successful assembly of Nanodiscs is highly dependent on the properties of the target protein. The choice of the types and ratios of MSPs, phospholipids, and detergents might require trials and titrations to optimize disc assembly. **A thorough review of the literature is essential for this aspect of Nanodisc construction.**^{3,12,13,14}

Successful incorporation of the target membrane protein into Nanodiscs most likely will require optimization of the following important parameters:

- Choice and concentration of secondary detergent for preparation of target membrane protein
- Choice and preparation of phospholipid
- Temperature of reconstitution
- Lipid to MSP ratio
- MSP to target protein ratio
