**Product Information**

**Sarcosine Assay Kit**

Catalog Number MAK073  
Storage Temperature –20 °C

---

**TECHNICAL BULLETIN**

**Product Description**

Sarcosine, also known as N-methylglycine, is an amino acid that participates in one-carbon metabolism, serving as a one-carbon donor in mitochondrial reactions. Elevated levels of sarcosine may indicate deficiencies in Vitamin B₁₂ and/or folate. Sarcosine is also an intermediate in glycine and choline metabolism. In the brain, sarcosine acts as an inhibitor of the type I glycine transporter, resulting in increased glycine levels and NMDA receptor activation suggesting it may be a therapeutic agent for the treatment of some mental illnesses such as schizophrenia, depression, or obsessive compulsive disorder.

In this assay, sarcosine concentration is determined by a coupled enzyme reaction, which results in a colorimetric (570 nm)/fluorometric ($\lambda_{ex} = 535/\lambda_{em} = 587$ nm) product, proportional to the sarcosine present. This kit is suitable for sarcosine detection in cell and tissue culture supernatants, plasma, serum, and other biological samples. Urine samples are not suitable for use with this assay because of sample interferences.

**Components**

The kit is sufficient for 100 assays in 96 well plates.

- **Sarcosine Assay Buffer**  
  Catalog Number MAK073A  
  25 mL

- **Sarcosine Probe, in DMSO**  
  Catalog Number MAK073B  
  0.2 mL

- **Sarcosine Enzyme Mix**  
  Catalog Number MAK073D  
  1 vL

- **Sarcosine Standard, 10 μmole**  
  Catalog Number MAK073E  
  1 vL

**Reagents and Equipment Required but Not Provided.**

- 96 well flat-bottom plate – It is recommended to use black plates with clear bottoms for fluorescence assays and clear plates for colorimetric assays.
- Fluorescence or spectrophotometric multiwell plate reader

**Precautions and Disclaimer**

This product is for R&D use only, not for drug, household, or other uses. Please consult the Material Safety Data Sheet for information regarding hazards and safe handling practices.

**Preparation Instructions**

Briefly centrifuge vials before opening. Use ultrapure water for the preparation of reagents. To maintain reagent integrity, avoid repeated freeze/thaw cycles.

- **Sarcosine Assay Buffer** – Allow buffer to come to room temperature before use.

- **Sarcosine Probe** – Warm to room temperature to thaw solution prior to use. Aliquot and store protected from light and moisture at –20 °C. Upon thawing, the Sarcosine Probe is ready-to-use in the colorimetric assay.

  For the fluorescence assay, dilute an aliquot of the Sarcosine Probe Solution 5 to 10-fold with Sarcosine Assay Buffer, just prior to use. This will reduce the background of the fluorescence assay.

- **Sarcosine Enzyme Mix** – Reconstitute in 220 μL of Sarcosine Assay Buffer. Mix well by pipetting, then aliquot and store, protected from light at –20 °C. Use within 2 months of reconstitution. Solution is sensitive to freeze/thaw cycles and should be stored in single-use aliquots.
Sarcosine Standard—Reconstitute in 100 µL of water to generate a 100 mM (100 nmole/µL) stock solution. Mix well by pipetting, then aliquot and store at −20 °C. Keep cold while in use. Use within 2 months of reconstitution.

Storage/Stability
The kit is shipped on wet ice and storage at −20 °C, protected from light, is recommended.

Procedure
All samples and standards should be run in duplicate.

Sarcosine Standards for Colorimetric Detection
Dilute 10 µL of the 100 mM (100 nmole/µL) Sarcosine Standard Solution with 990 µL of Sarcosine Assay Buffer to prepare a 1 mM (1 nmole/µL) standard solution. Add 0, 2, 4, 6, 8, and 10 µL of the 1 mM Sarcosine standard solution into a 96 well plate, generating 0 (blank), 2, 4, 6, 8, and 10 nmole/well standards. Add Sarcosine Assay Buffer to each well to bring the volume to 50 µL.

Sarcosine Standards for Fluorometric Detection
Dilute 10 µL of the 100 mM (100 nmole/µL) Sarcosine Standard Solution with 990 µL of Sarcosine Assay Buffer to prepare a 1 mM (1 nmole/µL) standard solution. Dilute 10 µL of the 1 mM standard solution with 90 µL of Sarcosine Assay Buffer to generate a 0.1 mM (0.1 nmole/µL) standard solution. Add 0, 2, 4, 6, 8, and 10 µL of the 0.1 mM Sarcosine standard solution into a 96 well plate, generating 0 (blank), 0.2, 0.4, 0.6, 0.8, and 1.0 nmole/well standards. Add Sarcosine Assay Buffer to each well to bring the volume to 50 µL.

Sample Preparation
Liquid samples like serum and plasma can be measured directly. Urine samples are not suitable for use with this assay because of sample interferences.

Tissue (10 mg) or cells (2 × 10⁶) can be homogenized in 100 µL of the Sarcosine Assay Buffer. Centrifuge the samples at 13,000 × g for 10 minutes to remove insoluble material.

Bring samples to a final volume of 50 µL with Sarcosine Assay Buffer.

For unknown samples, it is suggested to test several sample dilutions to ensure the readings are within the linear range of the standard curve.

Assay Reaction
1. Set up the Master Reaction Mix according to the scheme in Table 1. 50 µL of the Master Reaction Mix is required for each reaction (well).

2. Add 50 µL of the Master Reaction Mix to each of the wells. Mix well using a horizontal shaker or by pipetting, and incubate the reaction for 60 minutes at 37 °C. Cover the plate tightly and protect the plate from light during the incubation.

3. For colorimetric assays, measure the absorbance at 570 nm (A₅₇₀). For fluorometric assays, measure fluorescence intensity (λₑₓ = 535/λₑₘ = 587 nm).

Results
Calculations
The background for the assays is the value obtained for the 0 (blank) Sarcosine Standard. Correct for the background by subtracting the 0 (blank) value from all readings. Background values can be significant and must be subtracted from all readings. Use the values obtained from the appropriate Sarcosine standards to plot a standard curve.

Note: A new standard curve must be set up each time the assay is run.

Concentration of Sarcosine

\[
\frac{S_a}{S_v} = C
\]

S\(_a\) = Amount of Sarcosine in unknown sample (nmole) from standard curve
S\(_v\) = Sample volume (µL) added into the wells
C = Concentration of Sarcosine in sample

Sarcosine molecular weight: 89.1 g/mole

Sample Calculation
Amount of Sarcosine (S\(_a\)) = 5.84 nmole (from standard curve)
Sample volume (S\(_v\)) = 50 µL

Concentration of Sarcosine in sample

\[
\frac{5.84 \text{ nmole}}{50 \mu\text{L}} = 0.1168 \text{ nmole/µL}
\]

\[
0.1168 \text{ nmole/µL} \times 89.1 \text{ ng/nmole} = 10.41 \text{ ng/µL}
\]
